DIRECTA
ceramir®

Instruction for use English

Definition
Ceramir Pediatric Crowns are laser-ceramic pre-polymerized, hydro-fused bis-GMA-based matrix made of dental resins.

Composition
Barium glass
Bis-GMA-based matrix made of dental resins
Pigments
Additives
Catalyst

Technical data
Fitter content: 82 wt % variation range of inorganic filler particles less than 0.02-0.7 μm.

Features of Ceramir Pediatric Crowns

- Easy handling
- Excellent physical properties
- Easy and fast polishing
- Excellent adhesion to nano-technology and high degree of fillers (82 %)
- Excellent abrasion with natural behavior pattern
- Zinc and fluoride component provides antibacterial surface
- Radio-opaque

Indications

- Caries damage to tooth structure
- Restorations of tooth structures
- Restorations of all cavities from Class I to VI
- Mal-aligned teeth
- Tooth discoloration
- Automatic malformation
- Decomposition of dental restorations
- Abrasions
- Corrosions
- Cosmetic corrections
- Lifting of vertical dimension due to loss in the posterior region

Recommended applications

- Preparation of the dental cavity is recommended whenever feasible.
- Size of Ceramic Pediatric Crown
- The appropriate size of the pediatric crowns is selected using the appropriate size guide (Ceramir Pediatric Crown Sizing Guide). The sizing guide is placed over the deciduous teeth to restore the mesiodistal margins because visible on the transparent sizing guide and the best margins can be obtained by adjusting the Ceramir Pediatric Crown to the tooth.
- Restoration of the tooth is quick and easy and provides a good aesthetic and functional end result that mimics the natural dentition. Minimal preparation is required and is limited by the extent of the caries, hence there is no need to remove the enamel.
- Ceramir Pediatric Crowns are cemented with a conventional resin composite, bioceramic cements like Ceramir Crown & Bridge cement or resin composite ionomer cements can also be used. Follow the instructions from the manufacturer.
